Abstract

UBV observations of the massive binary system TT Aur were carried out mainly at the Turkish National Observatory (TUG). These observations, together with IUE spectra and times of eclipse minima collected from the literature, were used to study the system parameters. Simultaneous solution of the light curves by the Wilson-Devinney code allows a semi-detached configuration with a slightly larger Roche-lobe filling secondary. This picture is supported by other evidence. The shoulders of the primary minimum suggest some excess absorption, in keeping with circumstellar material in the form of a disk-like structure around the primary component. The deeper primary minimum in the U filter may indicate a hotter region on the secondary-facing hemisphere of the primary. The period variation of the system can also be related to the possible existence of a third component in a circular orbit around the system. An alternative detached representation is also considered using optimal curve-fitting techniques. We appeal for further observations to help resolve some outstanding issues in this interesting massive binary.

Publication Date:	09/2001
Keywords:	STARS: BINARIES: ECLIPSING, STARS: INDIVIDUAL: SV CAM
ADS:	2001A&A...376..158A
Abstract	New BVR light curves and times of minimum light for the short period RS CVn system SV Cam were analysed to derive the physical parameters of the system and the parameters of the third body orbit. The light curves obtained at the TÜBİTAK National Observatory during two nights in 2000 show considerable asymmetry and night-to-night variations. The analysis of the light curves is made using Djurasevic's inverse problem method. The Roche model with spotted areas on the hotter primary component yields a good fit to observations. The extensive series of published photoelectric minima times indicate that the eclipsing pair orbits around the common mass center of the triple system with a period of 41.32 yr. Table 1 is only available in electronic form at the CDS via anonymous ftp to cdsarc.u-strasbg.fr (130.79.128.5) or via http://cdsweb.u-strasbg.fr/cgi-bin/qcat?J/A+A/376/158

Title:	Solar radius determinations obtained with the CCD astrolabe at TUBITAK National Observatory
Authors:	Gölbaşı, O.; Chollet, F.; Kılıç, H.; Sinceac, V.; Aslan, Z.; Sözen, E.
Journal:	Astronomy and Astrophysics, v.368, p.1077-1082.
Publication Date:	03/2001
Keywords:	SUN: GENERAL, SUN: OSCILLATIONS, SUN: PHOTOSPHERE, ASTROMETRY, ATMOSPHERIC EFFECTS
ADS:	2001A&A...368.1077G
Abstract	This paper measures the solar radius, using the new Tubitak National Observatory astrolabe as well as data acquisition and reduction procedures. The mean values of the solar radius obtained are slightly lower than the other results to which they are compared. We have compared our results with data obtained since 1981, and show that our results are very homogeneous. We hope to extend these measurements to obtain accurate determinations of solar position.

Keywords:	ASTRONOMICAL OBSERVING TECHNIQUES, INSTRUMENTATION
ADS:	2001AstL...27..398A
Abstract	The AZT-22 telescope installed in Turkey (Antalia) was aligned and tested on stars by the Hartmann method. The rms normal deviation of an equivalent optical system is 0.040 ± 0.016 micrometers. The circle of confusion is 0.40 ± 0.04 arcsec in diameter at a 50% energy level.
